

Surabaya

Bandung

Jakarta

Analyzing local weather trends of 3 Indonesia cities along with global weather trends

Extracting Data

| year | avg_temp_bandung | avg_temp_world |
|------|------------------|----------------|
| 1825 | 24.64 | 8.39 |
| 1839 | 23.93 | 7.63 |
| 1840 | 23.86 | 7.8 |
| 1841 | 23.39 | 7.69 |
| 1850 | 24.15 | 7.9 |
| 1851 | 24.33 | 8.18 |
| 1852 | 24.21 | 8.1 |
| 1853 | 24.13 | 8.04 |
| 1854 | 24.28 | 8.21 |
| 1855 | 24.36 | 8.11 |

Extracted Data form example which is extracted with SQL query (the query listed in the SQLtext notes)

Null Value

| year | avg_temp_bandung | avg_temp_world |
|------|------------------|----------------|
| 1825 | 24.64 | 8.39 |
| 1839 | 23.93 | 7.63 |
| 1840 | 23.86 | 7.8 |
| 1841 | 23.39 | 7.69 |
| 1850 | 24.15 | 7.9 |
| 1851 | 24.33 | 8.18 |
| 1852 | 24.21 | 8.1 |
| 1853 | 24.13 | 8.04 |
| 1854 | 24.28 | 8.21 |
| 1855 | 24.36 | 8.11 |
| | | |

As noticed in example, some of the year are missing due to Null value. In order to be able to give an accurate observation, all of the years with Null value are omitted.

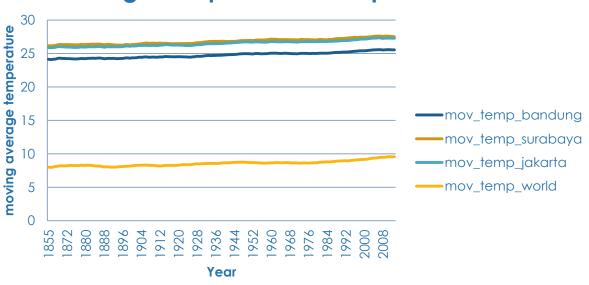

Moving Average Application

| year | avg_temp_bandung | avg_temp_world | mov_temp_bandung | mov_temp_world |
|------|------------------|----------------|------------------|----------------------|
| 1825 | 24.64 | 8.39 | | |
| 1839 | 23.93 | 7.63 | | |
| 1840 | 23.86 | 7.8 | | |
| 1841 | 23.39 | 7.69 | | |
| 1850 | 24.15 | 7.9 | | |
| 1851 | 24.33 | 8.18 | | |
| 1852 | 24.21 | 8.1 | | |
| 1853 | 24.13 | 8.04 | | |
| 1854 | 24.28 | 8.21 | | |
| 1855 | 24.36 | 8.11 | =AVERAGE(H2:H11) | =AVERAGE(\$K2:\$K11) |

In order to make it easier to observe, the moving average is used to both the average temperature of the cities and world by averaging 10 data entries

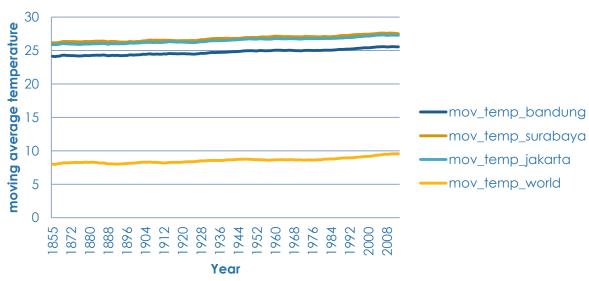

Line Chart

Average Temperature Comparison Chart

Observation 1

All of the cities are hotter (especially Surabaya) than world average temperature

Observation 1

| Year | Bandung differences | Surabaya differences | Jakarta differences |
|------|---------------------|----------------------|---------------------|
| 1855 | 16.123 | 18.169 | 17.877 |
| 1856 | 16.127 | 18.166 | 17.884 |
| 1866 | 16.091 | 18.135 | 17.853 |
| 1867 | 16.059 | 18.11 | 17.816 |
| 1868 | 16.112 | 18.165 | 17.859 |
| 1869 | 16.081 | 18.147 | 17.82 |
| 1870 | 16.051 | 18.127 | 17.786 |
| 1871 | 16.031 | 18.113 | 17.762 |
| 1872 | 16.012 | 18.109 | 17.723 |
| 1873 | 15.988 | 18.089 | 17.708 |

It can be inferred that the changes has been consistent as shown in the example of the table of cities temperature differences with global temperature

Observation 2

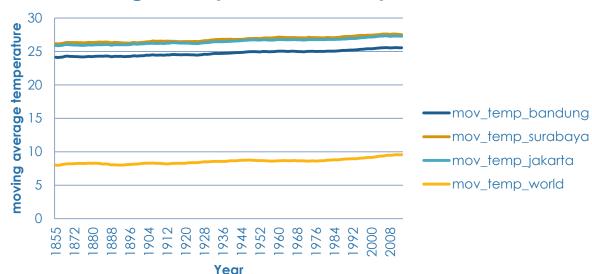

Correlation coefficient

$$R_{bdg} = 0.959$$

$$R_{sby} = 0.955$$

$$R_{ikt} = 0.957$$

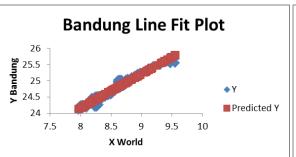

Average Temperature Comparison Chart

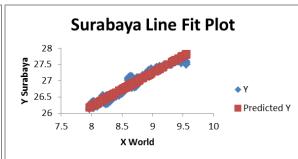

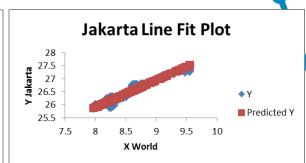

The correlation indicating that there is a strong positive relationship between each cities average temperature with world average temperature

Observation 3

Regression Model

$$Y_{bdg} = 15.82 + 1.04 X_{world}$$

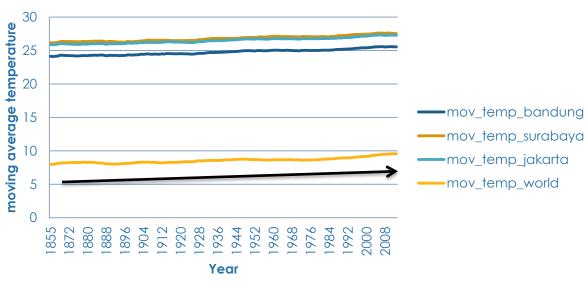

$$Y_{sby} = 18.002 + 1.03 X_{world}$$

$$Y_{jkt} = 18.002 + 1.03 X_{world}$$

With the help of regression, we can also estimate the average temperature of each cities by knowing the world average temperature by fitting it in the model

Observation 4

There is a strong trend in the long-run that the average temperature getting hotter each year with slight variation.

Conclusion

All of the cities are hotter (especially Surabaya) than world average temperature and their changes has been consistent

Strong and positive correlation coefficient between each cities and world average temperature indicates that strong ties

Each cities have their own models which can indicate each of their average temperature by knowing the world average temperature

Strong trends that each year all of the cities and world average temperature getting hotter in the long run
